The majority of the world’s population live in cities. Rapid urbanization is presenting challenges to all countries, but its pace and scale are greatest in low and middle income countries. While cities are the economic engines of the globe and often drive the culture, arts and innovation in a given society, they also consume most of the energy and generate the majority of air pollution and solid waste. It is therefore the health of cities, and those living and working in them, that will shape the global conditions for life and the potential for achieving the Sustainable Development Goals. This talk will explore the opportunities and challenges in advancing urban health.

Pizza will be served!  Info and Registration: [https://www.mcgill.ca/ihsp/events](https://www.mcgill.ca/ihsp/events)
