ABSTRACT

To date there is no consensus on how to assess functional impairment in individuals with mild cognitive impairment (MCI). Thus, clinicians are still left without much guidance on how to assess functional impairment in this population. Considering that functional performance is a key component in the early MCI diagnosis, there is an urgent need to develop standards to guide functional assessment process. The overall goal of this project is to conduct a consensus meeting with health care professionals with expertise in MCI diagnosis and propose recommendations for the clinical community on functional assessments for early detection of MCI.
